

Intra Nutri-Mix

Intra Nutri-Mix

The energy booster for young piglets

- Gives young piglets a boost
- Supports the maintenance of normal gastric acidity
- Promotes a good intestinal flora
- Assists digestion
- Supports the immune system

Intra Nutri-Mix

The energy booster for young piglets

The importance of a good start

In intensive livestock farming, animals are subject to high expectations. Fast growth, responsible health and an optimal feed/growth ratio. Because the animals are subject to high expectations, the use of high-quality animal feeds is very important. The risk of nutrient deficiency is increased by the increased performance of the animals and may cause the digestive system of the animals to become disturbed.

Disturbed intestinal flora:

Another great risk is that the intestinal flora is disturbed. A disturbed flora allows pathogenic (harmful) microorganisms to develop, resulting in: intestinal damage, reduced feed intake and poor manure.

Essential nutrients:

Intra Nutri-Mix is a mixture containing easily absorbable and essential nutrients. Intra Nutri-Mix contains a wide range of active components such as: high-quality and essential amino acids (threonine, methionine, tryptophan and lysine), chelated minerals, all dissolved in organic acids.

The amino acids are essential building blocks for animals and offer them support for growth and improving their resistance. The unique combination of amino acids in Intra Nutri-Mix gives the animals an extra boost and precisely those elements that they need in the initial stage of growth.

The chelated minerals reinforce this effect and create an intestinal climate where some bacteria do not feel comfortable. In addition, zinc keeps the intestinal epithelium in good condition.

The organic acids support the maintenance of a normal gastric acidity, having a beneficial effect on protein digestion. Particularly with young animals, this is very important because acid formation in the stomach is not optimal yet.

Dosage recommendation:

Piglets (Nutri-Mix dosage)	
Piglets	Dosage
Pre weaning by digestion problems: min. 3 days	1 l / 1,000 l
5 days directly after weaning	1 l / 1,000 l

Dosage recommendation: through drinking water

Use 1 l of Intra Nutri-Mix per 1,000 l of drinking water, as needed, for 5 to 7 days.

Intra Nutri-Mix reduces the pH of the water to about 4-4.5. If the pH of the drinking water is higher than 7.5, the dose may optionally be increased.

Transport

UN 3265 Corrosive liquid, acidic, organic, n.o.s. (contains propionic acid, formic acid, lactic acid) 8, II (E).

Other information

The product does not pollute the drinking water system. Store in a frost-free place.
