

# Liquid premix for animals based on acids and minerals

## IntraAqua Acid

Mineral

- To provide relief in stressful situations
- Boosts digestion
- Improves productivity
- Represses growth of pathogenic bacteria
- Farmer can choose: with or without minerals

IntraCare

# Liquid premix for animals based on acids and minerals

## IntraAqua Acid

For fear of resistance to pathogenic bacteria, the use of antibiotics as growth stimulants is under increasing scrutiny. Changes to the feed composition through, e.g. the removal of antibiotics, can cause diminished production results and a reduction in the general health-condition of the animals. Growth and digestion problems can also occur after vaccination or through higher stress levels. To address these problems, extra measures must be taken.

### Acids

Intra Aqua Acid Mineral is a drinking water supplement based on a mixture of the organic acids lactic acid, formic acid, propionic acid. It deploys a synergetic impact, which means that the acids have a mutually enhancing effect. The product is administered via the drinking water and contributes to optimising the production results. When Intra Aqua Acid Mineral is used, the acidity level (pH) of the drinking water is decreased, in the process inhibiting the growth of pathogenic bacteria. In addition, the gastro-intestinal flora is boosted and protein digestion improves, which enhances the digestion process in general.

### Minerals

Besides the supporting activity of the organic acids, the extra addition of the mineral copper (E4) and zinc (E6) contributes to a higher level of efficiency.

Acids are especially active during the initial stages of the digestion process, whereas the minerals copper and zinc are specifically active further along in the stomach/intestinal system.

Copper, for example, has a strong growth supportive function and destroys many pathogenic bacteria. The mineral zinc has a property that improves the vitality of the animal.

Specifically the combination of these components, gives improved performance in many cases.

### Dosage advice

To 1000 litres of drinking water a minimal dose of 0.5-1.5 litre Intra Aqua Acid Mineral is added.

Continuous dosage is not necessary; however, this depends on the individual situation in the barn and might be necessary.

By observing the prescribed minimal dosage, an optimal acidity level is achieved.

### Guidelines

Stop administering during vaccinations. Do not use these products in simultaneous combination with medicines. Products can be kept for at least 24 months if stored in unopened packaging

### Safety

The product can cause irritation to the eyes, the respiratory tract and the skin. Keep out of reach of children. If the product comes into contact with the eyes, rinse immediately with a copious amount of water and seek expert medical advice.

### Packing

#### Intra Aqua Acid Mineral can be delivered in:

- 25 kg cans
- 225 kg barrels
- 1000 kg container

The products fully comply with the acceptability requirements of GMP/HACCP/QS and are fully biologically degradable. We strongly advise against simultaneous combinations of these products with medicines. Products can be kept for at least 24 months if stored in unopened packaging
